## Mission Design and Measurement Approach

Sun-synchronous exact repeat orbit  
6pm ascending node  
Altitude 657 km

Beams point toward the night side to avoid sun glint

### Science Data Validation

More than 300 surface validation observations per day

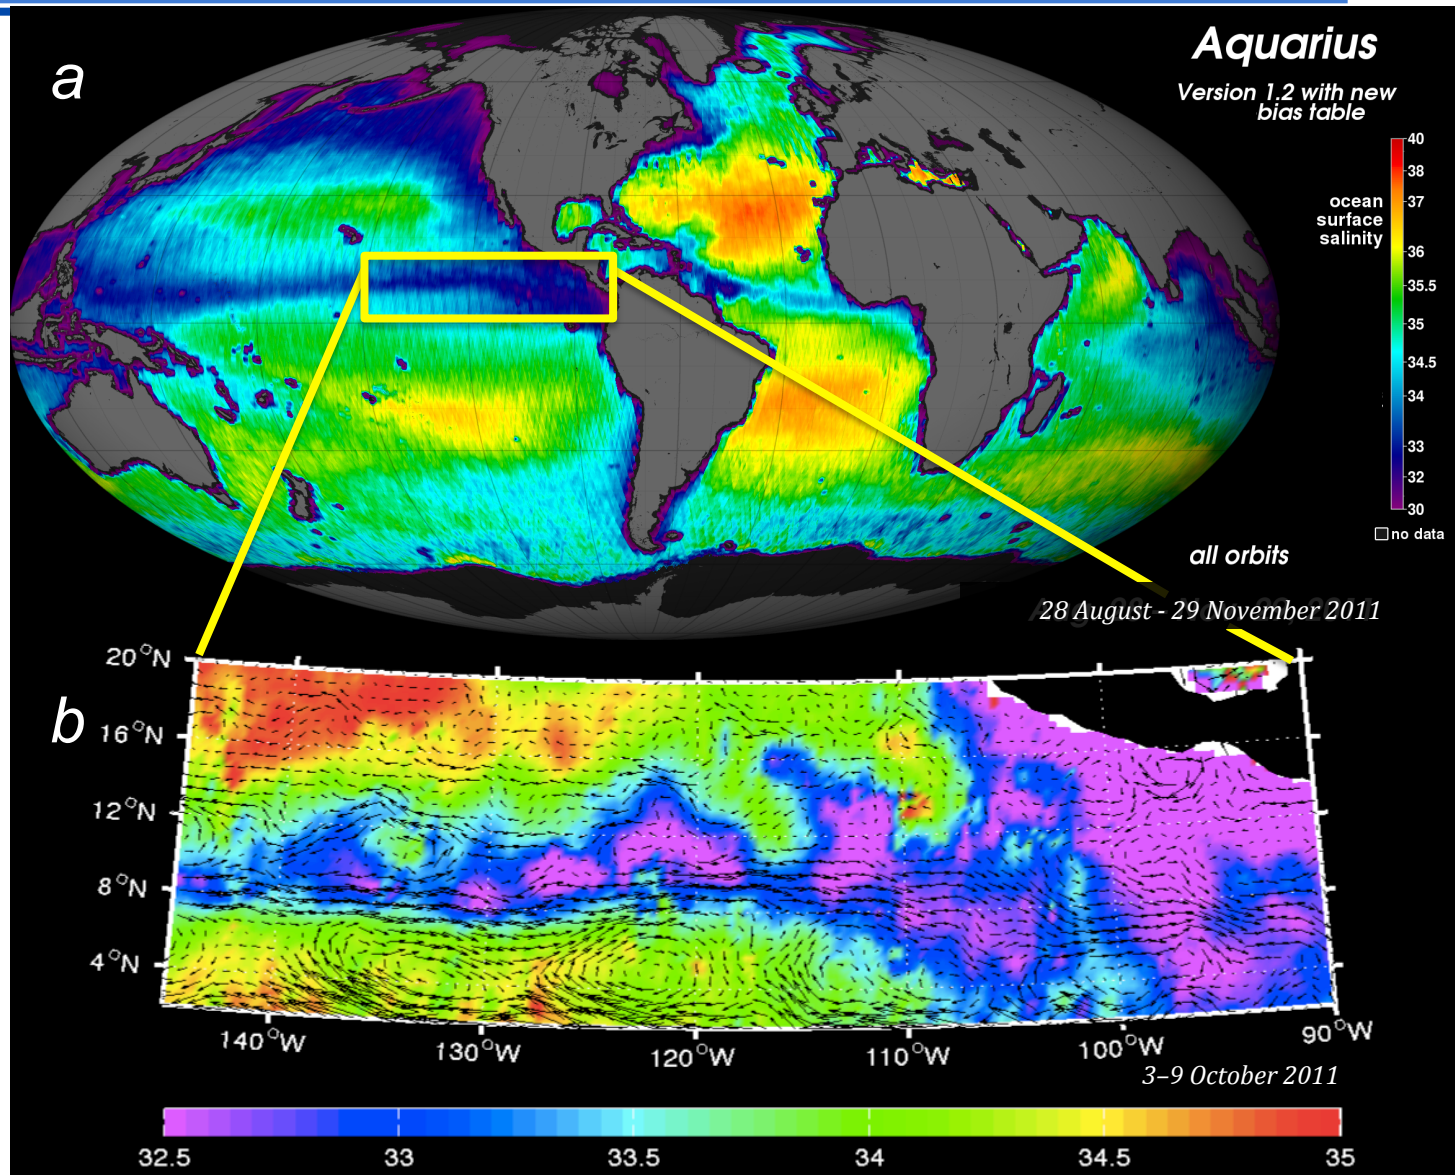

390 Km (242 Mi)

Salinity Data  
150km, Monthly, 0.2 (psu)

- Calibration Drift
- Roughness Correction
- Ascending – descending differences
- Regional biases (geographically correlated error)
- Pointing angle offsets (K. Hilburn, RSS)

Beam	Nadir	Azimuth
1	0.55	0.10
2	0.55	0.30
3	0.55	0.00

August

September

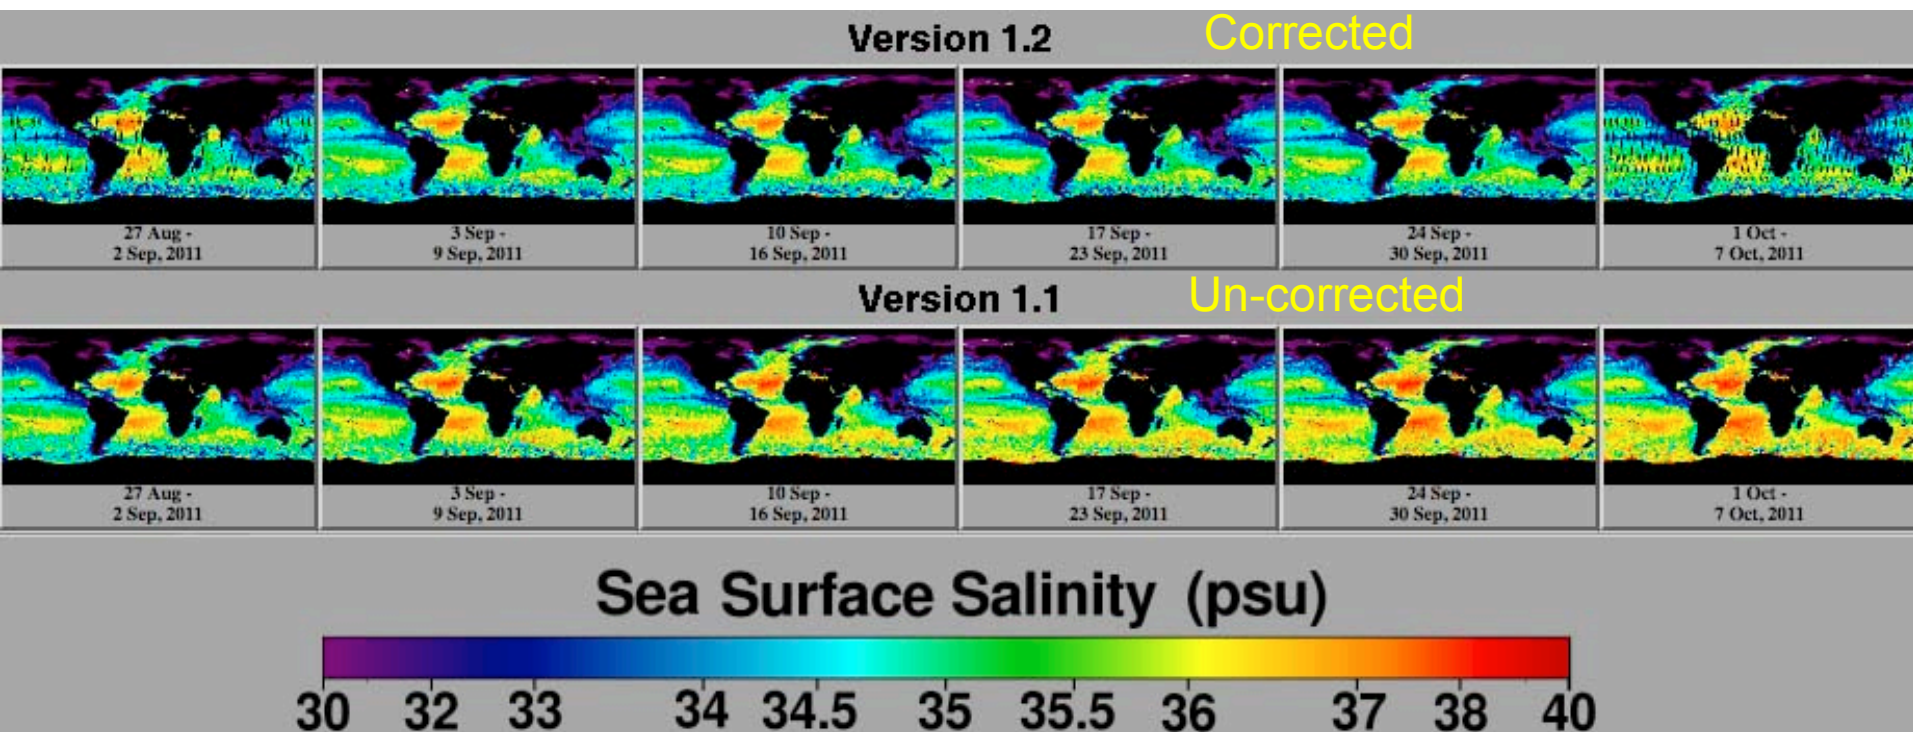

October

November

- Orbit by orbit bias correction using a running 7-day global average  $T_a - T_{a_{\text{expected}}}$ ,  
Descending passes only
- $T_{a_{\text{expected}}}$  is based on HyCOM model salinity and forward radiative transfer model.

Landfrac &lt; 0.05

difference between cpa SSS and in situ SSS

On average, Aquarius SSS is biased low in the low-mid latitudes and biased high in higher latitudes, especially the Southern Ocean.

Aquarius is biased low near coastal and ice boundaries, as expected.

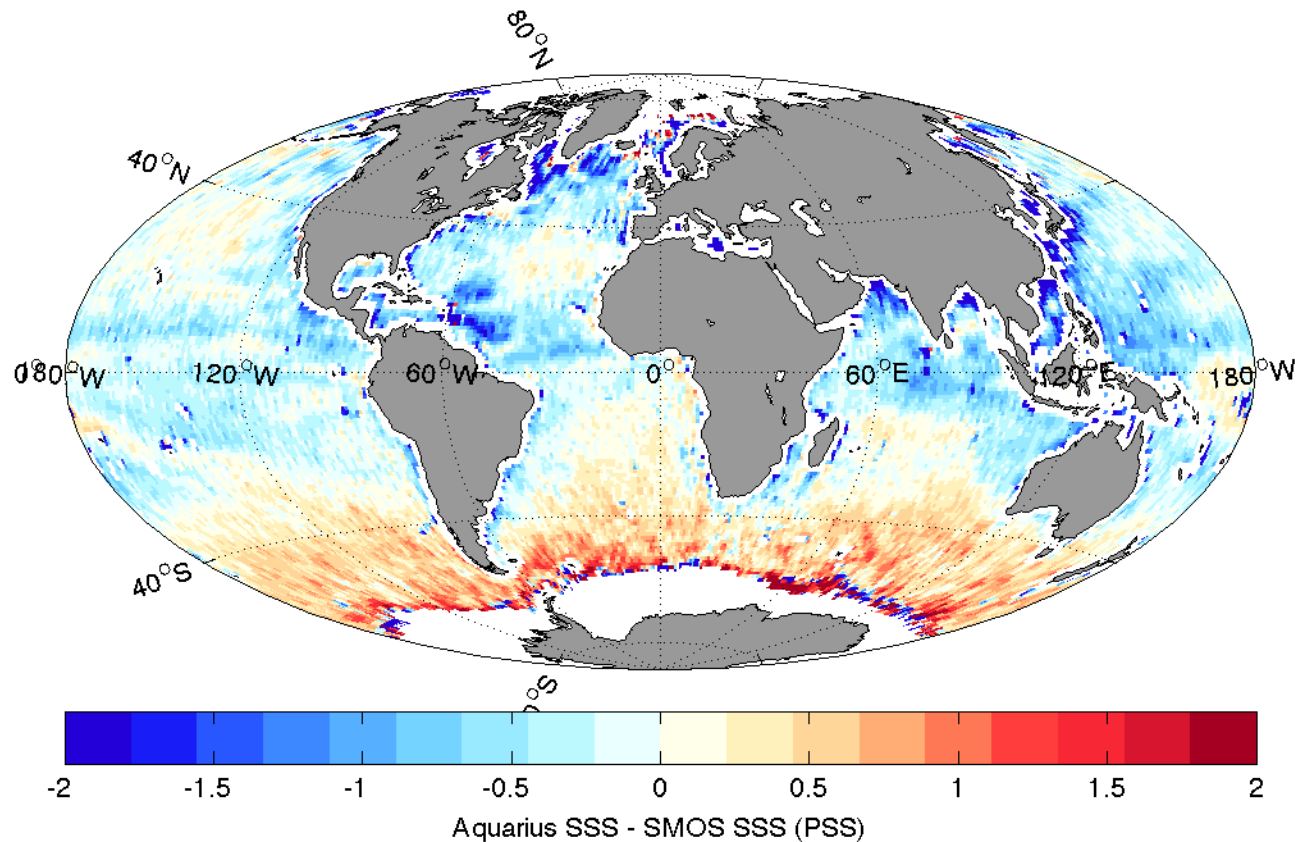

SMOS 1deg

Aquarius  
1deg

- Same sign and similar signature as at higher frequency bands.
- Significant magnitude above 10 m/s.
- Needs to be incorporated into retrieval algorithm.

- **Running V1.1 code operationally; 2-3 day latency**
  - First post-launch re-calibrations in early September after preliminary analyses:
  - Now known to have a calibration drift relative to late August
  - Uses NCEP ancillary winds, but no wind direction applied
- **V1.2 (with empirical radiometer bias correction, updated scatterometer wind and flags).**
  - Delayed mode; currently available through 29 December 2011.
  - Expect to be phased out after V1.3 (below)
- **V1.3 expected changes in work to be released perhaps in February-March**
  - Implement internal radiometer drift correction model
  - Discontinue empirical 'reference salinity' drift correction
  - Shift from NCEP winds to hybrid with scatterometer winds
  - Implement wind direction (azimuth) correction
  - Some updates to L2 parameters and names
- **V1.4, V1.5, V1.6, .... as required**
- **V2.0 will probably be implemented later in 2012, after Buenos Aires Science Meeting.**

# AQUARIUS

Sea Surface Salinity from Space

Home | Overview | Science | Tech & Ops | Gallery | Education | News | Links | People | Forum | Docs | **Data**

## About Aquarius ▶

Aquarius is a focused effort to measure Sea Surface Salinity and will provide the global view of salinity variability needed for climate studies. The mission is a collaboration between NASA and the Space Agency of Argentina (Comisión Nacional de Actividades Espaciales). [MORE >>](#)

### First Map from Aquarius

Aquarius has produced its first map of global ocean salinity. The map is a composite of the first two and a half weeks of data since the instrument became operational on August 25. Yellow and red colors represent areas of higher salinity, with blues and purples indicating areas of lower salinity. [Learn more >>](#)
